

35kV busbar span

Overview

A Medium-Low Voltage Bus Bar is a rigid conductor system rated for approximately 0.4 kV to 35 kV, used in substations, distribution rooms, industrial plants, and new-energy power stations to carry and distribute high currents. It replaces traditional cables, offering higher current-carrying. The busbar sizing calculator determines the required busbar dimensions based on the continuous current rating, short circuit withstand, and thermal limits for switchgear assemblies. The current rating is calculated from the conductor cross-sectional area, material (copper or aluminium), and maximum. This busbar pipe features a robust construction suited for 35KV high voltage systems, available in a vibrant red color for easy identification. Each roll spans 15 meters, providing ample length for extensive electrical setups. Because of its compact dimensions, relative light weight and user-friendly design. SKBT-HV High Voltage Heat shrink busbar insulation tubing is a kind of continuous tubing made of radiation cross-linked polyolefin which carries excellent insulating performance.
