

Bipolar Modulation Optical Module

Overview

Bipolar electro-optical phase modulator can achieve two-stage continuous modulation of the phase of optical signals. The proposed modulation-demodulation strategy can effectively identify each symbol's start and end time so. In this work, we propose a bipolar complementary pulse width modulation strategy based on the differential signaling system, and the modulation-demodulation methods are introduced in detail. As a result, crucial system dynamics in the digital control framework can be effectively. oversampled direct detection receiver. The bipolar constellations gain u pared to coherent re-ceivers-.
