

Core switch fails to obtain DHCP after restarting

Overview

To troubleshoot DHCP issues using network traces, follow these steps: Install Wireshark on both the affected DHCP client and the DHCP server. Choose the network interface used for DHCP on both devices by. In this troubleshooting video, I worked through a scenario where PCs 1 and 2 could not obtain an IP address from a core switch DHCP server. I first checked and adjusted the DHCP excluded addresses, ensuring only the default gateway was excluded. But from yesterday many users (LAN and Wifi) are facing issue as they are getting disconnected from network due to not getting any ip via DHCP from core switch. When static ip is given there is no issue. In practice, this can mean anything from minor workgroup productivity losses to catastrophic VoIP. For more information, see DHCP Basics. Before you begin to troubleshoot, check the following items. When did the problem start?

Are there any error messages?

Was the DHCP server working previously, or has it never worked?

If it worked. However in one client laptop whenever i restart my pc the connection to my dhcp server is lost and i have to manually renew the lease by using the commands `ipconfig /release` and `ipconfig /renew`. Is there any way by which it is automatically connected to the server upon restart/shutdown?

I assume. When a switch fails, it's crucial to determine which layer of the OSI model the problem originates from to effectively troubleshoot and resolve the issue. If the entire switch is unresponsive, or,
