

Electrical properties of laser diodes

Overview

This article discusses the characteristics common to laser diodes, such as high coherence, narrow spectral width and high directivity, while also explaining and defining these terms. Laser diodes (LD) are semiconductor devices that convert electrical energy into high-power optical energy. : 3 Driven by voltage, the doped. The current-voltage (I-V) characteristics of a laser diode describe the relationship between the current flowing through the device and the voltage applied across it. In such a heterostructure of a bipolar interband laser, electrons and holes can recombine, releasing the energy. A laser diode, similar to a light emitting diode (LED), is comprised of a junction between two semiconductors (one positive, one negative). This junction is known as a p-n junction.

A laser diode is electrically a PIN diode. The active region of the laser diode is in the intrinsic (I) region, and the carriers (electrons and holes) are pumped into that region from the N and P regions respectively. While initial diode laser research was conducted on simple P-N diodes, all modern lasers use the double-hetero-structure implementation, where the carriers and the photons are confined in order to maximiz
