

How to connect the power distribution box in the elevator machine room

AI Overview

The power distribution box in an elevator machine room should be connected to the main power source, elevator controller, and safety devices following manufacturer guidelines and local electrical codes.

Step 1: Verify Power Requirements Before connecting, confirm the voltage, phase, and amperage requirements of the elevator system. Most elevators use 3-phase AC power, and the main disconnect should match the elevator's rated current and voltage. Ensure the power is completely shut off before starting any wiring.

Step 2: Install the Main Disconnect The main disconnect should be installed in a readily accessible location within the machine room for emergency shutdowns. It serves as the primary point to isolate power to the elevator system. Use a fused or circuit breaker disconnect as specified by the elevator manufacturer, such as a Siemens Elevator Control Switch (ECS) for fused systems.

Step 3: Route Conduits and Raceways Run conduits or raceways from the building's main power source to the machine room. According to NEC 620.37 and local amendments, only raceways necessary for elevator devices should enter the machine room, minimizing unnecessary wiring. Ensure proper fire-stopping for any penetrations.

Step 4: Connect Power to the Distribution Box Inside the distribution box: Connect the incoming power lines to the main disconnect terminals. Connect the output lines from the disconnect to the elevator controller, motor starter, and other components such as lights, fans, and control circuits. Include a grounding connection to comply with NEC and safety standards.

Step 5: Integrate Safety Devices Connect fire alarm interface relays, shunt trip circuits, and battery lowering devices as required by code and manufacturer specifications. These devices ensure the elevator shuts down safely during emergencies.

Step 6: Label and Test Clearly label all wires...
