

# How to insert the optical module into the router

## AI Overview

To install an optical module in a router, ensure proper ESD protection, align the module correctly, insert it gently until it clicks, and verify the link status.

**Preparation and Safety** Before installation, power off the router if it does not support hot-swapping, and disconnect all cables from the device. Wear an ESD wrist strap or gloves and work on an ESD-safe surface to prevent electrostatic discharge that can damage the module. Keep the environment clean and dust-free to avoid contamination of optical connectors.

**Step-by-Step Installation**

**Identify the correct slot:** Locate the SFP or optical module slot on your router. Ensure the module type (SFP, SFP+, QSFP) and fiber type (single-mode or multimode) are compatible with the device.

**Remove dust plugs:** Take off the dust plug from the optical port and keep it for future use.

**Inspect the module:** Check the optical module for visible damage or defects before insertion.

**Align the module:** Hold the module by its sides or metal cage, with the connector facing down and label facing up. Ensure the keying mechanism matches the slot.

**Insert the module:** Gently slide the module into the slot until it clicks into place. Do not force it; if it does not fit, turn it over and try again.

**Secure the module:** Ensure the latch or clip engages to hold the module firmly in place.

**Connect the fiber:** After inspecting and cleaning the fiber-optic end-faces, attach the optical fiber cable to the module. Use dust caps on unused ports.

**Verification** Turn on the router and check the port status LED. A green light usually indicates the module is functioning correctly and a link is established. If the LED is off or amber, verify the module type, fiber connection, and power status.

**Additional Tips** Avoid frequent removal and reinsertion to extend module life. Clearly mark TX/RX ports on cables for proper orientation. Follow manufacturer-specific guidelines for la...
