

How to switch LEDKVM switches

AI Overview

LEDKVM switches can be switched using front panel buttons, keyboard hotkeys, or IR remote controls, with LEDs indicating the currently active device. Switching Methods

- 1. Front Panel Buttons** Most LEDKVM switches have buttons on the front panel corresponding to each connected computer. Press the button for the desired device, and the LED above it will light up (usually blue) to indicate the active computer. This method is straightforward and ideal for quick manual switching.
- 2. Keyboard Hotkeys** Many LEDKVM switches allow switching via keyboard shortcuts. Typically, you press a combination such as Scroll Lock twice followed by a number key corresponding to the target computer. The exact hotkey combination can often be customized in the KVM settings. This method is convenient when the KVM is not easily accessible.
- 3. IR Remote Control** Some models support infrared remote control. Point the remote at the KVM and press the button for the desired input. The LED indicators will update to show the selected device.

LED Indicators LEDs on the KVM switch provide visual feedback:

- Blue LED:** Indicates the currently selected computer.
- Inactive LEDs:** Show which computers are connected but not currently active.

Additional Tips Ensure all computers are properly connected via HDMI/USB or other supported interfaces before switching. If using USB peripherals like keyboards or mice, connect them to the designated USB ports on the KVM to ensure hotkey functionality. Some KVMs support dual display or extended display modes; ensure your monitor settings match the KVM configuration to avoid display issues. If switching fails, check power supply, cable connections, and that the KVM has completed its self-test after powering on. By using these methods, you can efficiently switch between multiple computers while keeping your peripherals and display setup intact.
