

How to thread 12 pigtails through a tube

AI Overview

Threading 12 pigtails through a tube can be done efficiently using a combination of careful preparation, guiding tools, and organized bundling to prevent tangling.

Preparation Organize the Pigtails: Align all 12 pigtails so that their ends are even and stripped if necessary. Keep them untangled and parallel to each other to reduce friction during threading.

Select a Guide: Use a flexible wire, string, or a thin rod as a threading guide. For fiber optic pigtails, a stiff yet smooth guide helps prevent bending or damage.

Threading Technique Bundle the Pigtails: Group the pigtails together using a small piece of tape or a twist tie near the ends to maintain a compact bundle.

Attach to the Guide: Secure the bundle to the end of your guide wire or rod. Ensure the connection is smooth to avoid snagging inside the tube.

Feed Through the Tube: Slowly push or pull the guide through the tube, keeping the pigtails aligned. For longer tubes, gently twisting the bundle can help reduce friction.

Use Lubrication if Needed: For tight or long tubes, a small amount of cable lubricant can ease the passage without damaging the pigtails.

Tips for Success Avoid Sharp Bends: Keep the tube and pigtails as straight as possible to prevent kinking or fiber breakage.

Work in Sections: If the tube is very long, consider threading a few pigtails at a time to maintain control.

Check for Snags: Periodically pull back slightly to ensure the pigtails are moving freely and not catching on the tube walls.

Final Adjustment: Once all pigtails are through, carefully untape or untwist the bundle and arrange them for splicing or connection.

By following these steps, you can efficiently thread multiple pigtails through a tube while minimizing the risk of tangling or damage. Using a guide and bundling the pigtails are key strategies for smooth installation.
