

How to use a round port industrial switch

AI Overview

To use a round port industrial switch, connect it to power, link your devices via the round ports, access the management interface through a console or network port, and configure network settings as needed.

Hardware Setup

Power Connection: Ensure the switch is connected to a stable power supply. Verify the switch powers on and the system indicators show normal operation.

Mounting: Secure the switch on a DIN rail or appropriate mounting bracket. Rotate the switch downward until it clicks into place, ensuring it is firmly attached.

Grounding: Connect a grounding cable from the switch to a proper earth ground to protect against electrical surges.

Device Connections: Use the round ports (often M12 or circular Ethernet connectors) to connect industrial devices. Ensure cables are compatible with the port type and rated for industrial environments.

Accessing the Switch

Console Port: Connect a console cable to the switch's console port and use terminal software to log in with the default or updated username and password.

Management Port: Alternatively, connect a computer to the management port and access the switch via a web browser or management software using the switch's IP address.

Configuration

Basic Settings: Check system information such as model, firmware version, and serial number. Set system name, time, and other basic parameters.

VLANs and Routing: Create VLANs according to your network requirements and assign ports. Configure routing between VLANs if devices need to communicate across networks.

Interface Settings: Set IP addresses, subnet masks, and enable or disable features like DHCP, port security, or PoE if supported.

Advanced Routing: Configure static or dynamic routing protocols (e.g., OSPF, EIGRP) if your network topology requires it.

Safety and Protection

Surge Protection: Install surge protectors on the live side of the AC power to prevent damage from lightning or power spikes.

Cable Verification: Always verify that the circuit is de-energized before connecting or disconnecting cables.
