

How to use the new fiber optic terminal box

AI Overview

Using a fiber optic terminal box involves careful preparation, mounting, fiber routing, splicing, labeling, and testing to ensure reliable network performance.

- Pre-Installation Preparation**
 - Select the location:** Choose a site that is easily accessible, secure, and suitable for the environment (indoor or outdoor) while considering future network expansion.
 - Check box type and capacity:** Confirm the terminal box supports the number of fibers and adapter types (SC, LC, FC, ST) required for your network.
 - Gather tools and accessories:** Prepare drills, screwdrivers, screws, cable ties, tubing, and any splice trays or adapters included with the box.
- Mounting the Terminal Box**
 - Secure the box:** Use expansion screws or manufacturer-recommended methods to firmly mount the box on a wall, rack, or DIN rail.
 - Ensure stability:** The box should be stable to prevent movement that could stress the fibers.
- Cable Entry and Management**
 - Route incoming and outgoing fibers:** Feed the fiber optic cables through designated entry points, maintaining the standard bend radius to prevent microbending or signal loss.
 - Organize slack:** Wind excess fiber neatly inside the box to avoid tangling and ensure easy access for future maintenance.
 - Use cable management features:** Utilize trays, clips, or tubing to separate fibers and maintain order.
- Splicing and Termination**
 - Splice pigtails to distribution fibers:** Most FTTH boxes use pre-connectorized pigtails; splice them to the incoming fibers using fusion or mechanical splicing.
 - Connect adapters:** Insert the spliced pigtails into the adapter panel, which serves as the user-facing interface.
 - Optional splitter installation:** If the box is splitter-ready, mount a PLC splitter inside according to the design requirements.
- Labeling and Documentation**
 - Label each fiber and port:** Clearly mark connections to simplify future troubleshooting and network expansion.
