## Overview

While each module has a defined acceptable input range (e., -14 dBm to +1 dBm), best practice is to aim for a midpoint zone, with safety margins on both ends: This ensures stable performance, resilience to fiber degradation, and protection from transient power fluctuations. (Example: Finisar. Digital Diagnostic Monitoring (DDM) Function Of Optical Modules enables real-time monitoring of module operation and fault location. Among them, transmit and receive optical power are core parameters for judging optical transceiver performance. Is it okay or is there a need for concern that some problem with speed and latency will be faced soon?

It should be less than -27 dBm at all times otherwise you will have. In the preceding command output, the information in bold shows the optical power of the optical module. If the value of Rx Optical Power is less than the receiving sensitivity, adjust the link or replace the optical module or optical fiber at the remote end; if the value of Rx Optical Power is too. Absolute optical power is measured in dBm or dB referenced to 1 milliwatt, about the power of a typical laser, and expressed as dBm. Here is a graph that shows the relationship of dBm to milliwatts and microwatts.
