

Passive Dense Wavelength Division Multiplexer

Overview

Passive CWDM is an implementation of CWDM that uses no electrical power. It separates the wavelengths using passive optical components such as bandpass filters and prisms. [citation needed] Dense WDM (DWDM) uses the C-Band (1530 nm-1565 nm) transmission window but with denser channel spacing. Channel plans vary, but a typical DWDM system would use 40 channels at 100 GHz spacing or 80 channels with 50 GHz spacing. Some technologies are capable of 12.5 GHz spacing (sometimes called. Corning DWDM multiplexers and demultiplexers utilize advanced thin-film filter and athermal waveguide technology designed for low insertion loss, high isolation, and excellent temperature stability in a totally passive device. In this case, passive WDM technology employs passive optical components to combine and divide multiple light wavelengths, thus. Wavelength division multiplexing (WDM) is a technology for increasing the transmission capacity of optical fiber communications by sending multiple data channels simultaneously through a single fiber, each on a different wavelength of light.
