

# The function of pigtail coil organizer

## Overview

The primary function of a pigtail is to serve as a pressure buffer between the process and the instrument. When installed correctly, it allows condensate to collect in the coil, creating a protective fluid barrier. The present invention relates to an apparatus for manufacturing a pigtail for a coil spring, which is capable of very quickly and easily manufacturing the pigtail portions of all types of pigtail coil springs by using a single apparatus, regardless of the diameter and pitch angle of the coil. The term pigtail refers to the physical appearance of the wire, which often resembles the curly tail of a pig before it is installed. The device has a pair of horizontally disposed parallel rollers (8), a core (22), a stopper (20) installed adjacent to the peripheral surface of the core (22) and vertically moving and rotating integrally with the core (22), a clamping jig. End of coil spring is formed as pigtail shape. Change of forming jig is necessary according to shape of pigtail. Pigtail. A pigtail is a coiled or looped section of tubing used in piping and instrumentation systems to absorb vibration, manage thermal expansion, and protect pressure instruments from direct exposure to process media.
