

# The router's fiber optic light is red

## AI Overview

A red LOS (Loss of Signal) light on your fiber optic router indicates that the device is not receiving a proper optical signal from your ISP, often due to cable issues, service outages, or router faults.

**Common Causes**

- Fiber Optic Cable Damage:** Physical cuts, sharp bends, or kinks in the fiber cable can disrupt the signal and trigger a red LOS light.
- Service Outage:** ISP maintenance, technical issues, or local network disruptions can cause the router to lose signal.
- Loose or Faulty Connections:** Improperly seated connectors or damaged ports on the router or ONT can prevent signal transmission.
- Router or ONT Malfunction:** Hardware or firmware issues in the router or Optical Network Terminal may result in a red light.
- Power Issues:** Fluctuations or interruptions in power supply can affect the router's ability to maintain a connection.

**Troubleshooting Steps**

- Check for ISP Outages:** Visit your ISP's website or social media pages to see if there is a known service disruption in your area.
- Inspect the Fiber Cable:** Ensure the fiber optic cable is undamaged, properly connected, and not sharply bent. Reseat the connector gently if needed.
- Power Cycle the Router/ONT:** Turn off the device, wait about 20 seconds, then power it back on. Allow a few minutes for the system to boot fully.
- Check Connections:** Confirm that all cables are securely plugged into the correct ports (WAN/ONT for internet, LAN for devices).
- Router Settings and Firmware:** If the red light persists, log into the router's admin panel to check for configuration errors or firmware updates.
- Contact ISP Support:** If the LOS light remains red after these steps, the issue may be on the line side, requiring technician inspection or service verification.

**Additional Notes**

A red LOS light is different from slow Wi-Fi or buffering; it usually indicates a signal-side problem rather than a minor in-home network issue. Avoid bending or pulling the fiber cable, as even slight damage can prevent the router from receiving a proper signal. Following these steps should help identify whether the problem is local (cables, rout...
