

There is a low-voltage electrical circuit next to the distribution box

Overview

LV distribution boards, part of the electrical distribution system, securely distribute low-voltage power to facility circuits. Integrated with ACBs and MCCBs, they provide protection from overloads, short circuits, and others. Engineering use: Engineers use low voltage layouts to size equipment, protect conductors, coordinate breakers, and maintain safe facility power. It is the infrastructure that moves electric power inside buildings and dwellings. In buildings and industrial facilities, they are often installed in an LV room and used to distribute, isolate, and protect. Low voltage distribution equipment typically operates at less than 600 volts; in contrast, medium voltage equipment affords a wider range of 600 to 38,000 volts.
