

What type of copper is the small busbar

Overview

Copper busbars are made from electrolytic tough pitch (ETP) copper (C11000) or oxygen-free high conductivity (OFHC) copper (C10200), depending on the required electrical and mechanical properties. In electric power distribution, a busbar (also bus bar) is a metallic strip or bar, typically housed inside switchgear, panel boards, and busway enclosures for local high current power distribution, transmission, or switching substations. They are also used to connect high voltage equipment at. Even though a busbar looks like just a flat copper or aluminum strip, its size determines how much electrical load it can handle. If it is oversized, it increases cost and space requirements unnecessarily. It serves as a critical component in electrical panels, substations, switchgear, and industrial power systems due to its low electrical resistance, excellent thermal. Busbars are metal strips or bars made of copper or aluminum.
